Esercizio 1. Assume L is countable and let $M \leq N$ have arbitrary (large) cardinality. Let $A \subseteq N$ be countable. Prove there is a countable model K such that $K \subseteq K \leq N$ and $K \cap M \leq N$ (in particular, $K \cap M$ is a model). Hint: adapt the *construction* used to prove the downward Löwenheim-Skolem Theorem.

Soluzione 1. We have $|L(A)| = \aleph_0$. We shall construct a chain $(A_i)_{i < \omega}$ of subsets of N such that $K = \bigcup_{i < \omega} A_i$ will be the wanted model.

We begin by setting $A_0 = A$ then we have $|A_0| = \aleph_0$ so $|L(A_0)| = \aleph_0$. Now let $(\varphi_k(x): k < \aleph_0)$ be an enumeration of all the formulas of $L(A_0)$ that are consistent in N. By construction there is a sequence $(a_k \in N: k < \aleph_0)$ such that $N \models \varphi_k(a_k)$ for all $k < \aleph_0$; moreover if $\varphi_k(x) \in L(M)$ we can chose a_k in M because of the Vaught-Tarski test. Finally we set $A_1 = A_0 \cup \{a_k \in N: k < \aleph_0\}$; note that $|A_1| = \aleph_0$. By iteration of this process we obtain the chain $(A_i)_{i < \omega}$.

As in the proof of the Downward Löwenheim-Skolem by construction we have that $|K| = \aleph_0$ and the Vaught-Tarski test can be used to show that $K \leq N$.

Similarly if $\varphi(x) \in L(K \cap M)$ then $\varphi(x) \in L(M)$ and so K will contain a solution that is also in M thus $K \cap M \leq N$ by the Vaught-Tarski test (and particularly $K \cap M$ is a model).

Esercizio 2. Prove either that $1a \Leftrightarrow 2a$, or that $1b \Leftrightarrow 2b$. (Choose whichever you prefer.)

1a. $X \subseteq \mathbb{R}$ is open;

- 1b. $X \subseteq \mathbb{R}$ is closed;
- 2a. $b \approx a \in X \implies b \in {}^*X$ for every $b \in {}^*\mathbb{R}$.
- 2b. $a \in {}^*X \Rightarrow \operatorname{st} a \in X$ for every finite $a \in {}^*\mathbb{R}$.

Open and closed are understood w.r.t. the usual tolopology on $\ensuremath{\mathbb{R}}.$

Esercizio 3. (Bonus question) For which sets $X \subseteq \mathbb{R}$ does the following hold?

2. $b \approx a \in {}^*X \Rightarrow b \in {}^*X$ for every $a, b \in {}^*\mathbb{R}$.
